

DEEP GLITCH

I decided to call my invention Deep glitch, because its at the bottom of the sea and there's a glitch in the ocean, it's getting warmer.

Deep glitch is an appliance that cools our oceans.

It is in the shape of a bubble, and it absorbs the energy from the sun. With that energy, it takes ocean water and turns it cold. The cold water is then sent back into the ocean to cool it down. It is a very useful tool. It keeps the zooplankton alive. They are a very important element in the food chain. Without them our oceans would be empty, the level of carbon would increase in the air and that would influence all our lives. That's how deep glitch can help our world.
